

autoPortfolio — Portfolio Breakdown

The 30 holdings, their sectors, and the weights

August 2026

What this is

A snapshot of the **\$40,000 paper portfolio**: 30 large, highly-liquid US stocks, held in roughly **equal weight** (target 3.33% each), spread across 8 sectors with a cap of **5 names per sector**. Only **one share class per company** is held (e.g. Alphabet is held once, via GOOGL — not GOOG and GOOGL both). Weights below are as a % of invested money.

Sector breakdown

Sector	# of stocks	Sector weight
Financials	5	16.4%
Information Technology	5	15.4%
Industrials	5	15.2%
Health Care	4	13.8%
Consumer Discretionary	3	11.0%
Consumer Staples	3	10.4%
Communication Services	3	10.0%
Energy	2	7.8%
Total	30	100%

No sector exceeds ~19%, and the top holding is under 4% — this is a deliberately diversified book, not a concentrated bet.

All 30 holdings

Stock	Sector	Shares	Stock weight
JPM	Financials	4	3.95%
HOOD	Financials	15	3.65%
V	Financials	3	3.09%
BRK-B	Financials	2	2.87%
GS	Financials	1	2.86%

Stock	Sector	Shares	Stock weight
INTC	Information Technology	14	3.55%
AAPL	Information Technology	4	3.47%
NVDA	Information Technology	6	3.38%
AMD	Information Technology	2	2.68%
MU	Information Technology	1	2.31%
AAL	Industrials	86	3.69%
VRT	Industrials	5	3.39%
GE	Industrials	3	3.03%
GEV	Industrials	1	2.78%
CAT	Industrials	1	2.29%
JNJ	Health Care	5	3.60%
ABBV	Health Care	5	3.52%
UNH	Health Care	3	3.49%
LLY	Health Care	1	3.23%
AMZN	Consumer Discretionary	5	3.81%
HD	Consumer Discretionary	4	3.73%
TSLA	Consumer Discretionary	4	3.50%
KO	Consumer Staples	16	3.94%
WMT	Consumer Staples	12	3.75%
COST	Consumer Staples	1	2.67%
NFLX	Communication Services	19	3.83%
META	Communication Services	2	3.13%
GOOGL	Communication Services	3	3.00%
XOM	Energy	9	3.93%
CVX	Energy	7	3.87%

Weights range ~2.2%–3.9% around the 3.33% target. The gap is purely whole-share rounding: on a \$40k account a \$1,000+ stock can only buy 1 share, so it lands a bit light. Fractional shares would tighten this.

Why these 30 stocks were chosen

The selection rule is simple and mechanical — **no forecasting, no stock-picking opinions**:

- **Most liquid first.** We rank the eligible large-cap US universe (S&P 1500) by trading liquidity and take the top names. Liquid stocks have tiny spreads and barely move when you trade them, so the strategy is cheap and realistic to run. (Thinly-traded names look great in backtests but bleed money live.)
- **One share class per company.** If a company has two listed share classes (Alphabet's GOOG/GOOGL, etc.), we keep only the more-liquid one — otherwise we'd unknowingly hold a double-weight bet on that single company and waste a slot.
- **Capped at 5 per sector.** Without a cap, “most liquid” becomes one-third technology — a hidden sector bet. The cap forces the book across 8 sectors. Testing confirmed the cap **did not lower returns** — the edge comes from being diversified and cheap to trade, not from a tech tilt.

- **Equal weight.** Each name gets the same 1/30 slice. In honest testing, plain equal weight beat five “smarter” weighting schemes — a well-known result (“1/N is hard to beat”). It needs no estimates, so nothing can go wrong.

How readjustment works

Two separate clocks run the portfolio:

1. Which stocks you hold — refreshed quarterly (~every 3 months). Every quarter the strategy re-ranks the universe by liquidity and rebuilds the top-30, still one share class per company, still capped at 5 per sector, still equal weight. Names that have become more liquid come in; names that have faded drop out. Turnover is very low (~4% a year), so trading costs stay near zero. Between rebalances the holdings do not change.

2. How much is invested vs. in cash — reviewed weekly. Separately, every Monday the strategy checks market volatility and sets an “invested fraction” so the portfolio’s risk stays near a 15%-per-year target. In calm markets it is ~100% invested (like now); in turbulent markets it moves part of the money to cash to cut the drawdown, then re-invests when things settle. To avoid needless trading, it only adjusts when the target moves more than **10 percentage points** from where it is (a “no-trade band”).

So: **the list of 30 changes quarterly; the invested-vs-cash dial moves weekly (and only past the 10-point band).** Everything is logged in plain English each time it runs, so you can always see what changed and why.
